# Great Lakes and St. Lawrence River Medium Resolution Vector Shoreline Data<sup>1</sup>

Deborah H. Lee, Charles Morse, and Sameer Bandhu

**ABSTRACT.** Digital medium-resolution vector maps of the Great Lakes and St. Lawrence River shoreline are compiled by the Great Lakes Environmental Research Laboratory (GLERL), and translated into multiple common formats including the Topological Vector Profile of the Spatial Data Transfer Standard (SDTS), to enhance data accessibility. The data were originally produced by the Detroit District, U.S. Army Corps of Engineers and Water Issues Division of Environment Canada - Ontario Region for the International Joint Commission's Levels Reference Study, and used to assess the influence of lake levels on shore erosion. The vector maps include a three tier classification representing the shoreline geomorphic nature, the extent of shoreline protection, and the nearshore subaqueous geomorphic nature. Metadata, documented in accordance with SDTS specifications, accompanies the digital maps. This work was done in conjunction with the National Geophysical Data Center to develop medium resolution vector coastline data for the conterminous United States, and was funded by NOAA's Earth System Data and Information Management Program. Potential exists for use of the data in shoreline management and environmental and coastal processes studies.

## 1. INTRODUCTION

The development of geographic information system (GIS) technology now allows the digital manipulation and compilation of complex spatial datasets. However, proprietary data formats of commercial GIS software has limited the portability of datasets from their originators to other potential users. In recognition of this problem, the National Committee for Digital Cartographic Data Standards and the Standards Working Group of the Federal Interagency Coordinating Committee on Digital Cartography proposed the Spatial Data Transfer Standard (SDTS). After considerable review and testing, the standards were published as Federal Information Processing Standard (FIPS) 173 in 1992 (National Institute of Standards and Technology, 1992). The SDTS forms the cornerstone of the National Spatial Data Infrastructure (NSDI), created by Executive Order dated April 11, 1994. The NSDI requires all federal agencies to produce new, and to the extent practicable, existing geospatial data using the SDTS.

The Great Lakes Environmental Research Laboratory (GLERL), in conjunction with the National Geophysical Data Center, was funded by NOAA's Earth System Data and Information Management Program to produce medium resolution vector coastline data for the conterminous United States using the SDTS. This technical memorandum documents GLERL's compilation and translation of the Great Lakes and St. Lawrence River shoreline data to SDTS and other common formats.

## 2. GREAT LAKES-ST. LAWRENCE RIVER VECTOR SHORELINE DATA

The Great Lakes-St. Lawrence River shoreline (American and Canadian) was mapped and classified in support of the International Joint Commission's Levels Reference Study to assist in quantifying the effect of lake levels on erosion (Working Committee 2, 1993). A three tier classification scheme was used as shown in Table 1. The first tier classifies the shoreline by its geomorphic nature, the second tier by the percent of shore protection, and the third tier by the nearshore subaqueous type. The American shoreline was delineated based on aerial photography, mapped at a scale of 1:24,000, and was classified by the U.S. Army Corps of Engineers (United States Army Corps of Engineers, 1992). The Canadian shoreline was mapped by digitizing 1:50,000 scale National Topographic Series (NTS) maps for the lower Great Lakes, and 1:250,000 NTS maps for upper Lake Huron and Lake Superior, and was classified by Geomatics International for Environment Canada (Geomatics International, 1992). Figures 1-4 illustrate the mapped data for selected locations.

**Table 1.--Three Tier Classification Scheme**

<i>Shoreline Geomorphic Nature Classification</i>		<i>Shoreline Protection Classification</i>	
1	High (>15m) Bluff	1	Highly Protected: 70-100 percent of reach/segment protected
2	High (>15m) Bluff with Beach	2	Moderately Protected: 40-70 percent of reach/segment protected
3	Low (<15m) Bluff	3	Minor Protection: 15-40 percent of reach/segment protected
4	Low (<15m) Bluff with Beach	4	No Protection: <15 percent of reach/segment is protected
5	Sandy/Silty Banks	5	No Protection: <15 percent of reach/segment is protected
6	Clay Banks	6	Unclassified
7	Sandy Beach/Dunes	9	Unclassified (coded by the compiler)
8	Coarse Beaches		
9	Baymouth-Barrier Beaches	<i>Nearshore Subaqueous Geomorphic Nature Classification</i>	
10	Bedrock (Resistant)	1	Clay
11	Bedrock (Non-resistant)	2	Sand
12	Low Riverine/Coastal Plain	3	Sand/Gravel Lag Over Clay
13	Open Shoreline Wetlands	4	Bedrock (Resistant)
14	Semi-Protected Wetlands	5	Bedrock (Non-Resistant)
15	Composite	6	Unclassified
16	U.S. Shore: Unclassified	9	Unclassified (coded by the compiler)
16	Canadian Shore: Artificial		
17	U.S. Shore: Artificial		
17	Canadian Shore: Unclassified		
99	Unclassified (coded by the compiler)		

Because these datasets resided in separate locations in different proprietary geographic information system formats, the complete database was not readily available to users. The Great Lakes Environmental Research Laboratory was uniquely positioned to create the unified database for distribution and archival because of established working relationships with all parties, the resources and experience of their geographic information system laboratory, and NOAA's desire to create medium resolution vector coastline data for the conterminous United States.

GLERL obtained the data from the Detroit District, U.S. Army Corps of Engineers and Water Issues Division of Environment Canada - Ontario Region and translated the data into the Topological Vector Profile of the Spatial Data Transfer Standard, as well as Arc/Info export and ASCII formats. To further enhance compatibility, the data were transformed from various projections to one common projection, Albers Equal Area, and also into geographic coordinates. The procedures used are detailed in the metadata found in Appendix A. The metadata were compiled in accordance with the Federal Geographic Data Committee's Content Standards for Digital Geospatial Metadata (Federal Geographic Data Committee, 1994).

### 3. DATA AVAILABILITY

The data are available to users via anonymous ftp over the Internet from GLERL's anonymous ftp site, **ftp.glerl.noaa.gov**. GLERL's ftp site can also be accessed from GLERL's web page, **www.glerl.noaa.gov**. The directory structure is shown on the following page:

## 4. ACKNOWLEDGMENTS

The assistance of Mr. Roger Gauthier, Detroit District, U.S. Army Corps of Engineers and Ms. Wendy Leger, Water Issues Division of Environment Canada - Ontario Region in providing the data is greatly appreciated. The technical advice of Ms. Lisa Jipping, Detroit District, U.S. Army Corps of Engineers was essential to completion of this project. The authors would also like to thank those who reviewed the dataset prior to its release and made useful and instructive comments: Mr. Kurt Kowalski, Great Lakes Science Center, National Biological

Survey, Dr. Yichun Xie, Eastern Michigan University, Dr. David Schwab, GLERL, and Mr. Ian Gillespie, Water Issues Division of Environment Canada - Ontario Region. This work was done in conjunction with Dr. George Sharman of the National Geophysical Data Center to develop medium resolution vector coastline data for the conterminous United States, and was funded by NOAA's Earth System Data and Information Management Program.

## Appendix A. Metadata

### Metadata for the Great Lakes and St. Lawrence River Medium Resolution Vector Shoreline Data

#### Identification\_Information:

##### Citation:

Originator: Great Lakes Environmental Research Laboratory (compiler)  
Publication\_Date: 19971201  
Publication\_Time: 00000000  
Title: Great Lakes and St. Lawrence River Medium Resolution Vector Shoreline Data  
Edition: 1.0  
Geospatial\_Data\_Presentation\_Form: Map  
Publication\_Information:  
Publication\_Place: Ann Arbor, MI, U.S.A.  
Publisher: Great Lakes Environmental Research Laboratory  
Other\_Citation\_Details: NOAA Technical Memorandum ERL GLERL-104  
Online\_Linkage: ftp://ftp.glerl.noaa.gov/gis/shoreline/  
Larger\_Work\_Citation: Vector Coastline Data for the Conterminous U.S. including the Great Lakes,  
National Geophysical Data Center, Boulder, CO, USA.  
Scale\_Denominator: varies from 24000 to 250000

#### Description:

Abstract: A medium resolution vector map of the Canadian and U.S. Great Lakes and St. Lawrence River shoreline is segmented into reaches and classified using a three tier scheme representing the geomorphic nature of the shoreline, the extent of shoreline protection, and the geomorphic nature of the nearshore sub-aqueous shoreline. The classification scheme is as follows:

##### Shoreline Geomorphic Nature Classification:

- 1 High (>15m) Bluff
- 2 High (>15m) Bluff with Beach
- 3 Low (<15m) Bluff
- 4 Low (<15m) Bluff with Beach
- 5 Sandy/Silty Banks
- 6 Clay Banks
- 7 Sandy Beach/Dunes
- 8 Coarse Beaches
- 9 Baymouth-Barrier Beaches
- 10 Bedrock (Resistant)
- 11 Bedrock (Non-resistant)
- 12 Low Riverine/Coastal Plain
- 13 Open Shoreline Wetlands
- 14 Semi-Protected Wetlands
- 15 Composite
- 16 U.S. Shore: Unclassified
- 16 Canadian Shore: Artificial
- 17 U.S. Shore: Artificial
- 17 Canadian Shore: Unclassified
- 99 Unclassified (coded by the compiler)

Shoreline Protection Classification:

- 1 Highly Protected: 70-100 percent of reach/segment protected
- 2 Moderately Protected: 40-70 percent of reach/segment protected
- 3 Minor Protection: 15-40 percent of reach/segment protected
- 4 No Protection: <15 percent of reach/segment is protected
- 5 Non-Structural
- 6 Unclassified
- 9 Unclassified (coded by the compiler)

Nearshore Subaqueous Geomorphic Nature Classification:

- 1 Clay
- 2 Sand
- 3 Sand/Gravel Lag Over Clay
- 4 Bedrock (Resistant)
- 5 Bedrock (Non-Resistant)
- 6 Unclassified
- 9 Unclassified (coded by the compiler)

Combined Classification:

The above codes are appended into a 3 to 4 digit code representing the combined classification. The right-most digit represents the nearshore subaqueous classification, the second digit from the right represents the shoreline protection classification, and the left-most one or two digits represent the shoreline geomorphic classification.

Purpose:

The shoreline vectors and classification scheme were originally developed by Environment Canada and the U.S. Army Corps of Engineers to evaluate the influence of lake level effects on erosion for the International Joint Commission's Levels Reference Study. Potential exists for use of the data in shoreline management, and environmental and coastal processes studies.

Supplemental\_Information:

Revisions: None

Reviews\_Applied\_to\_Data:

The U.S. data were received from the U.S. Army Corps of Engineers, Detroit District. After conversion by GLERL of the data from INTERGRAPH vector format to the ARC/INFO vector format (see Procedures Used), the vector data were checked to ensure consistent topology. Visual inspection of the processed data overlaying the original data and other shoreline datasets was used to check for any gross processing errors. Shoreline classification codes in the processed U.S. data were verified manually by comparing computer and hard copy maps to hard copy maps provided by the Detroit District. Reviews applied during the production of the data by the originators are described in the references listed below (see Other References Cited).

The Canadian data was received from the Water Issues Division of Environment Canada, Ontario Region, in Arc/Info vector format. After modifying attribute item definitions and appending the attribute information to the vector files (see Procedures Used), the processed data were visually inspected as described above and the classification codes were verified by comparing computer and hard copy maps to hard copy maps provided by Environment Canada. Reviews applied during the production of the data by the originators are described in the references cited below (see Other References Cited).

Related\_Spatial\_and\_Tabular\_Data\_Sets:

None.

#### Other\_References\_Cited:

Working Committee 2. Annex 2, Land Use and Management. International Joint Commission Levels Reference Study, Great Lakes-St. Lawrence River Basin. International Joint Commission, Washington, D.C. and Ottawa, Canada (1993).

United States Army Corps of Engineers. Summary, Shore Mapping and Classification Project: United States Shoreline. Memorandum for Record, Coastal Engineering Research Center, Vicksburg, Mississippi, 14 pp. (1992).

Geomatics International. Great Lakes Shoreline Classification and Mapping Study: Canadian Side. Final Report Submitted to the Erosion Processes Task Group, Working Committee 2, International Joint Commission Levels Reference Study, International Joint Commission, Washington, D.C. and Ottawa Canada, 44 pp. plus Appendices and Maps (1992).

#### Time\_Period\_of\_Content:

Calendar\_Date: Unknown

Currentness\_Reference:

The aerial photography used to generate the U.S. shoreline vector data was acquired in 1979 for the State of Michigan and in 1987-1989 for the other seven Great Lakes. The time period of content for the Canadian shoreline vector data is unknown to the compiler.

The U.S. and Canadian shoreline classification was completed in 1992 from a variety of variously dated materials. The shoreline protection classification may change significantly as time increases from the date of the original classification. More information on the currentness of the vector and classification data is contained in the references cited above (see Other References Cited).

#### Access\_Constraints:

There are no access constraints on the U.S. data. Unlimited use and reference of the Canadian shoreline data is granted upon condition that Water Issues Division of Environment Canada - Ontario Region is credited as the source.

#### Data\_Set\_Credit:

The data were originally produced by the U.S. Army Corps of Engineers and Environment Canada for the International Joint Commission's Levels Reference Study, Great Lakes-St. Lawrence River Basin, by Working Committee 2, Land Use and Management, and used to assess the influence of lake levels on shore erosion. The U.S. shoreline data were obtained from the Detroit District, U.S. Army Corps of Engineers, Detroit, Michigan. The Canadian shoreline data were obtained from Water Issues Division of Environment Canada - Ontario Region. The Great Lakes Environmental Research Laboratory, Ann Arbor, Michigan compiled the data and translated them into multiple common formats including the Topological Vector Profile of the Spatial Data Transfer Standard, to enhance the accessibility of the data. This work was done in conjunction with the National Geophysical Data Center to develop medium resolution coastline data for the conterminous United States, and was funded by NOAA's Earth System Data and Information Management Program.

#### Completeness\_Report:

The data include vector representations of the Great Lakes shoreline, their connecting channels, the St. Lawrence River, and many (but not all) islands. Some man-made features such as the Keweenaw Waterway (Lake Superior) are excluded. The vector end-nodes of some of the U.S. counties and Canadian regions are not consistent with their adjacent county or region. Most of the shoreline is classified with the exception of most islands, Isle Royale (Lake Superior) being a notable exception.

Use\_Constraints:  
Vector Shoreline:  
The vector data are intended for general planning, study, and illustrative purposes. The data are not intended for uses that require a high degree of positional accuracy.

Shoreline classification:  
The process of shoreline classification was essentially subjective and based almost entirely upon descriptive criteria. The classification of each reach was the result of the subjective interpretation of the individual doing the work and was based on their understanding of the classification scheme, the information available, and the experience of the individual. The shoreline protection classification may change significantly as time increases from the date of the original classification. Other limitations are the inadequacy of the classification scheme to encompass the complete range of shoreline characteristics, and insufficient detail of the data sources to permit classification. Inconsistencies in classification may exist.

Procedures\_Used:  
U.S. Data:  
INTERGRAPH format shoreline files, by U.S. county, were obtained from the Detroit District U.S. Army Corps of Engineers ftp server, ftp://ftp@155.79.125.194/pub/. These files were stored on the HP 735/9000 GIS workstation at the Great Lakes Environmental Research Laboratory. The procedures used to convert and process a given INTERGRAPH file were essentially the same for all of the counties: a file was converted to two ARC/INFO vector format covers--one for the shorelines and one for the breaklines (hash marks that intersect the shorelines at the reach endpoints)--using the ARC command IGDSARC with the subcommand

shoreline 61 \* \* \* \* for shorelines and break 3 \* \* \* \* for breaklines. ARC attribute tables (AAT), in INFO format, were then generated for the shoreline and breakline covers using the ARC command BUILD with the line option. Next, the shoreline and breakline covers that were generated from the same INTERGRAPH file were appended together using the ARC command APPEND. An AAT was then built for the resulting appended cover using BUILD with the line option.

#### Canadian Data:

The Canadian data were obtained from Waters Issue Division, Environment Canada in ARC/INFO format. Some of these covers had items which were dropped from the covers' associated arc attribute tables. These items included PLOTKEY, REACHKEY, ITEM2, and ITEM1. This was done to prepare the AAT files before joining the INFO tables that contained the shoreline classification codes. The items in these tables included REACH\_KEY, GEOMORF, PROTECTION, and NEARSHORE. The item GEOMORF was altered to spell GEOMORPH. Then these tables were joined to each shoreline cover's AAT using the ARC/INFO command, JOINITEM, specifying the cover-id item in the AAT as the relate item and using the LINK option. This process placed the Canadian data in the same format as the U.S. shoreline data.

#### U.S. and Canadian Data:

The covers were projected from their original projections and map coordinate systems to Albers Equal-Area Conic. This was done by using the ARC command PROJECT with the cover option and the appropriate input and output parameters, listed below. Note that for Michigan county shoreline covers, which were in the Michigan State Plane Coordinate System prior to projecting to Albers, ARC software permitted specifying "stateplane" for the projection, instead of specifying an actual projection and projection parameters. When stateplane is entered, the user is prompted for a FIPS code zone number (FIPSZONE). FIPSZONE numbers were determined from Table 4 in the ARC command reference for the PROJECT command. The FIPSZONES entered were 2111, 2112, and 2113 (North, Central, and Southern Michigan, respectively).

#### ---Input (source) Projection Parameters Used---

For southern Michigan counties:

Projection: Lambert Conformal Conic

Units: Feet

FIPS code zone number: 2113

Datum: NAD27

Spheroid: Clarke 1866

1st Standard Parallel: 42 06 00 (degrees, minutes, seconds)

2nd Standard Parallel: 43 40 00

Central Meridian: -84 20 00

Origin (Latitude): 41 30 00

False Easting (m): 609,601.21920

False Northing (m): 0

For central Michigan counties:

Projection: Lambert Conformal Conic

Units: Feet

FIPS code zone number: 2112

Datum: NAD27

Spheroid: Clarke 1866

1st Standard Parallel: 44 11 00 (degrees, minutes, seconds)

2nd Standard Parallel: 45 42 00

Central Meridian: -84 20 00

Origin (Latitude): 43 19 00

False Easting (m): 609,601.21920

False Northing (m): 0

For northern Michigan counties:  
Projection: Lambert Conformal Conic  
Units: Feet  
FIPS code zone number: 2111  
Datum: NAD27  
Spheroid: Clarke 1866  
1st Standard Parallel: 45 29 00 (degrees, minutes, seconds)  
2nd Standard Parallel: 47 05 00  
Central Meridian: -87 00 00  
Origin (Latitude): 44 47 00  
False Easting (m): 609,601.21920  
False Northing (m): 0

For counties in Wisconsin, Illinois, and Indiana:  
Projection: Oblique Mercator  
Units: meters  
Spheroid: Clarke 1866  
Projection Type: 2 (central line defined by one point and its angle of azimuth)  
Scale factor at the projection center: 0.9999  
Longitude of the projection center: -87.0  
Latitude of the projection center: 44.0  
Azimuth at the projection center: 15  
False easting: -1000000.0  
False northing: -4300000.0

For counties in Minnesota:  
Projection: Oblique Mercator  
Units: meters  
Spheroid: Clarke 1866  
Projection Type: 2 (central line defined by one point and its angle of azimuth)  
Scale factor at the projection center: 0.9999  
Longitude of the projection center: -88 50 00.256  
Latitude of the projection center: 47 12 21.554  
Azimuth at the projection center: 285.6952  
False easting: 9000000.0  
False northing: -1600000.0

For counties in Ohio and New York:  
Projection: Oblique Mercator  
Units: meters  
Spheroid: Clarke 1866  
Projection Type: 2 (central line defined by one point and its angle of azimuth)  
Scale factor at the projection center: 0.9999  
Longitude of the projection center: -78.0  
Latitude of the projection center: 44.0  
Azimuth at the projection center: 55.666670  
False easting: -3950000.0  
False northing: -3430000.0

All Canadian Shorelines:  
Projection: Universal Transverse Mercator (UTM)

Units: Meters

UTM Zones:

Zone 16 for Canadian Shorelines of Lake Superior and St. Mary's River

Zone 17 for Canadian Shorelines of Lake Huron, St. Clair River, Lake St. Clair, Detroit River, Lake Erie, Western Lake Ontario, and the Niagara River

Zone 18 for Canadian Shorelines of Eastern Lake Ontario and the St. Lawrence River

--Output Projection Parameters Used--

Projection: Albers Equal-Area Conic

Units: meters

Spheroid: Clarke 1866

1st Standard Parallel: 29.5

2nd Standard Parallel: 45.5

Central Meridian: -96

Origin (Latitude): 23.0

False Easting (m): 0

False Northing (m): 0

U.S. Data:

The U.S. covers, when first converted from INTERGRAPH to ARC, had pseudonodes at every vertex. Thus, arc segments were very short and did not extend across the reach from one breakline to another. After projection to Albers Equal Area, the ARC command CLEAN was used to establish arc-node topology so that pseudo-nodes could be removed. The covers were processed using CLEAN with the line option, a dangle length of 0, and a fuzzy tolerance of 2 meters. The coordinate precision of the U.S. covers remained double precision. All covers were CLEANed only once. All pseudo-nodes were then removed by selecting all arcs using the ARC module ARCEDIT and then using the ARCEDIT command UNSPLIT with the none option. Changes to the edit coverage were saved and ARCEDIT was quit.

AATs were rebuilt using BUILD with the line option. Then ARCEDIT was again launched and a coverage chosen for editing. All arcs were selected, and the user-id (<cover>-id) was reset to equal the internal-id (<cover>#) using the ARCEDIT command CALCULATE. Then the items GEOMORPH, PROTECTION, NEARSHORE, and COMBINED were added to the AAT using the ARCEDIT command ADDITEM with input and output width of 4 and data type integer.

A graphical user interface was created to simplify the editing and coding of arcs. Arcs were selected and edited using ARCEDIT commands such as DELETE and UNSPLIT and coded using CALCULATE. Codes for the COMBINED item were determined from hardcopy maps generated from the original INTERGRAPH files, obtained from the Detroit District U.S. Army Corps of Engineers. An algorithm was developed to parse the COMBINED code into GEOMORPH, PROTECTION, and NEARSHORE values and automatically update these item values whenever a COMBINED code was entered for a selected arc. Arcs whose codes were ambiguous were given a combined value of 9999, which was also parsed, giving 99, 9, and 9 for the three classifications. All arcs representing breaklines were deleted, leaving only pseudonodes to mark the point along the shoreline where reaches end. In some cases, pseudo-nodes could not be removed (because ARC limits the number of vertices in an arc to 500). These pseudonodes can be distinguished from breakpoints because the codes of the adjoining arcs are the same.

U.S. and Canadian Data:

All covers in the Albers Equal Area projection were converted to ARC/INFO export files using the ARC command EXPORT with the COVER and FULL options. The covers were also converted to ASCII generate format files using the ARC command UNGENERATE with the LINE option. The companion INFO AAT tables were converted to comma delimited ASCII files using the ARC TABLES command UNLOAD with the

DELIMITED option. The covers were also projected and the same process used to create ASCII UNGENERATE files in geographic coordinates. To build polygon topology for conversion to SDTS, the covers projected to geographic coordinates were processed using the ARC command BUILD with the POLY option. These covers were then converted to SDTS Vector Topological Profile files using the ARC command SDTSEXPORT.
